Article Chosen :

Cybersecurity Enterprises Policies: A Comparative Study

Published in 2022

Was the selected research methodology appropriate to the study topic?

Yes, the study used a qualitative methodology, specifically a descriptive and documentary research model. This approach was appropriate for analyzing literature and identifying trends in cybersecurity governance.

Were the data collection tools appropriate?

Yes, the study utilized document analysis of published academic studies. Sources were gathered from reputable databases (e.g., Scopus, Web of Science, Google Scholar). The use of defined keywords and inclusion criteria helped ensure that the data collected was relevant to the research goals.

Was there a clear description of the study population, sample, and data collection tools?

Yes, the study clearly described its population as peer-reviewed literature from the past five years. The sample was determined based on specific keywords. Although no field instruments were used, the selection and categorization process was well documented.

Was the sample size appropriate for the depth of the study?

Yes, more than 70 studies were reviewed, providing sufficient data to identify patterns, challenges, and research gaps in the domain of cyber governance. The volume was adequate for a thorough thematic analysis.

Did the sample characteristics align with the subject of the study?

Yes, all selected studies focused on cyber governance or cybersecurity governance. They addressed relevant aspects such as legal frameworks, national and sectoral strategies, and policy challenges, aligning well with the paper's focus.

If statistical programs were used, was their application clearly explained?

No statistical tools were used, as the study was qualitative. Instead, content analysis and thematic categorization were used to interpret the findings, which was appropriate for the study's goals.
