Supervisor:

Dr. Asma Abuanzeh

year:

2024

Introduction:

Artificial Intelligence (AI) refers to the development of computer systems that can perform tasks typically requiring human intelligence. These tasks include visual perception, speech recognition, decision-making, and language translation. The growing importance of AI is evident as it transforms industries, economies, and societies worldwide (What Is AI (Artificial Intelligence)?, 2024). AI's ability to analyze vast amounts of data, learn from patterns, and make intelligent decisions positions it as a crucial driver of innovation and efficiency. From healthcare and finance to transportation and education, AI is revolutionizing how we approach complex problems and streamline operations, leading to improved outcomes and new possibilities (Alowais et al., 2023).

Saudi Arabia's Vision 2030 is a strategic framework aimed at reducing the country's dependence on oil, diversifying its economy, and developing public service sectors such as health, education, infrastructure, and tourism (Alasiri & Mohammed, 2022). Launched in 2016 by Crown Prince Mohammed bin Salman, Vision 2030 aims to position Saudi Arabia as a global investment powerhouse and a hub for innovation. Central to this vision is the integration of advanced technologies, including AI, to foster economic diversification and enhance the quality of life for Saudi citizens. The Saudi government recognizes that embracing AI and other technological advancements is essential for achieving its ambitious goals and ensuring sustainable development (Javaid et al., 2023).

The focus of this research is the application of AI in Saudi Arabian government projects. The study aims to explore how AI can be effectively integrated into various government sectors to enhance efficiency, improve public services, and drive innovation. By examining current AI implementations, identifying challenges, and proposing strategic solutions, this research seeks to provide a comprehensive understanding of AI's potential in transforming government operations. The research will also analyze the impact of AI on project and risk management practices within the government, highlighting best practices and success stories (Alshahrani et al., 2021).

To achieve these objectives, the study will employ a secondary research method using a mixed-methods approach. This methodology combines qualitative and quantitative data to provide a holistic view of AI applications in Saudi government projects. Secondary research involves the collection and analysis of existing data from various sources such as academic articles, government reports, case studies, and industry publications. This approach allows for a comprehensive review of current AI initiatives, providing insights into the effectiveness of these projects and identifying areas for improvement. By using a mixed-methods approach, the research will balance qualitative insights with quantitative data, ensuring a thorough and well-rounded analysis.

the study Problem:

Traditional approaches to government projects in Saudi Arabia have faced numerous challenges, undermining the efficiency, transparency, and overall effectiveness of public administration. One of the primary issues is inefficiency in project execution and management (Hashim, 2024). Bureaucratic processes, manual data handling, and outdated systems often lead to delays, increased costs, and suboptimal outcomes. Government projects frequently suffer from a lack of coordination among various departments, leading to duplication of efforts and wasted resources. Additionally, the sheer volume of paperwork and administrative tasks can overwhelm government employees, reducing their productivity and ability to focus on strategic initiatives (Zarour et al., 2021).

Another significant challenge is the lack of transparency in government operations. Traditional methods of project management and decision-making are often opaque, making it difficult for stakeholders to track progress and hold officials accountable. This lack of transparency can lead to corruption, misuse of resources, and a general mistrust in government institutions. Moreover, human error is a common problem in traditional project management (Farazmand et al., 2022). Errors in data entry, miscommunication, and oversight can have significant consequences, including project delays, cost overruns, and compromised quality of work. These errors are often compounded by the absence of real-time data and analytics, making it difficult for government officials to make informed decisions promptly (Ward et al., 2015).

Artificial Intelligence (AI) offers a promising solution to these challenges by transforming the way government projects are managed and executed. AI technologies can automate routine administrative tasks, significantly reducing the time and effort required for project management. This automation can streamline workflows, improve resource allocation, and enhance overall efficiency. For example, AI-driven project management tools can automatically schedule tasks, allocate resources, and monitor progress, ensuring that projects stay on track and within budget (Alowais et al., 2023).

AI can also enhance transparency in government operations. AI-powered analytics and reporting tools can provide real-time insights into project status, budget allocation, and resource utilization. This transparency enables stakeholders to monitor project progress and hold officials accountable for their decisions and actions. Furthermore, AI can help detect and prevent corruption by analyzing patterns and anomalies in financial transactions and project data, identifying potential issues before they escalate (Balasubramaniam et al., 2023).

In terms of reducing human error, AI systems excel in data processing and analysis, providing accurate and reliable information for decision-making. AI algorithms can analyze vast amounts of

data to identify trends, predict outcomes, and recommend optimal courses of action. This capability is particularly valuable in risk management, where AI can assess potential risks, forecast their impact, and suggest mitigation strategies. By providing data-driven insights, AI empowers government officials to make informed decisions, reducing the likelihood of errors and improving project outcomes (Giordano et al., 2021).

Given these potential benefits, the central research question guiding this study is: "How can AI be effectively applied to improve project and risk management in Saudi Arabian government projects?" This question aims to explore the practical applications of AI in enhancing the efficiency, transparency, and reliability of government project management. The research will investigate current AI implementations in Saudi government projects, identify best practices, and propose strategies for overcoming challenges associated with AI adoption. By addressing this question, the study seeks to provide actionable insights and recommendations for leveraging AI to transform government operations, in line with Saudi Arabia's Vision 2030 goals (Covvey et al., 2024).

The importance of the study:

The current study carries importance as it is being conducted to examine how artificial intelligence (AI) is being used in Kingdom of Saudi Arabia (KSA) government projects, specifically in project management and risk management. the primary goal of the study is to identify the potential advantages and disadvantages that comes in terms of implementing the AI based project management and risk management techniques. As per Alasiri & Mohammed (2022), KSA can boost public satisfaction, cut expenses, and improve project outcomes by effectively employing AI in risk and project management. therefore, this current study will not only help in understanding the current state of art of the AI technologies which are being used in the project and risk management, the challenges KSA organizations often face in terms of implementing AI based technologies, the way the challenges can be mitigated, but also provide suggestions on how legislators and project managers may create a more successful and efficient approach to risk management and AI-based project management in KSA government projects, eventually helping to realize the nation's Vision 2030 objectives.

Potential Benefits of AI Implementation

Increased Efficiency: AI technologies can automate a wide range of administrative and operational tasks within government projects. By leveraging AI-driven tools for scheduling, resource allocation, and progress monitoring, the government can significantly reduce the time and effort required for project management. Automation eliminates repetitive tasks, allowing government employees to focus on more strategic and value-added activities. This boost in efficiency can lead to faster project

completion times and reduced costs, ensuring that public resources are utilized more effectively (Contributor, 2024).

Better Decision-Making: AI systems excel at processing vast amounts of data and extracting meaningful insights. By integrating AI into project management, the government can access real-time data analytics and predictive modeling, enabling more informed and data-driven decision-making. AI can identify trends, forecast potential outcomes, and suggest optimal strategies, thereby enhancing the quality of decisions made by government officials. This capability is particularly crucial in complex projects where timely and accurate decisions can significantly impact the project's success (Alijasvi, 2023).

Reduced Risks: One of the key challenges in government project management is the ability to foresee and mitigate risks. AI can play a pivotal role in risk management by analyzing historical data, identifying patterns, and predicting potential risks. AI algorithms can assess the likelihood and impact of various risk factors, providing early warnings and suggesting mitigation strategies. This proactive approach to risk management can help prevent project delays, cost overruns, and other adverse outcomes, ensuring that projects are completed successfully and within budget (Kwon & Kang, 2018).

Enhanced Transparency: AI can also improve transparency in government operations by providing real-time visibility into project status, budget allocation, and resource utilization. AI-powered dashboards and reporting tools can offer stakeholders, including the public, a clear and comprehensive view of project progress. This transparency fosters accountability and trust in government institutions, as stakeholders can monitor the execution of projects and ensure that resources are being used appropriately (Matheus et al., 2021).

Contribution to Vision 2030 Goals

Successful AI integration into government project management can make a substantial contribution to achieving the goals of Vision 2030. By enhancing efficiency and reducing costs, AI helps in optimizing public expenditure, ensuring that more funds are available for other developmental initiatives. Improved decision-making capabilities enable the government to implement projects that are more aligned with the strategic objectives of Vision 2030, such as economic diversification and infrastructure development (Alhosani & Alhashmi, 2024).

Furthermore, reducing risks and enhancing transparency can lead to higher success rates for government projects, boosting public confidence and attracting foreign investments. AI-driven innovation in public services can also improve the quality of life for Saudi citizens, aligning with

Vision 2030's aim to create a vibrant society. For instance, smart city projects leveraging AI can provide citizens with enhanced public services, sustainable urban environments, and improved safety and security (Vian, 2020).

Objectives of the study:

The primary aim of this study is to explore how Artificial Intelligence (AI) can be effectively applied to improve project and risk management in Saudi Arabian government projects. This overarching goal can be broken down into several specific objectives that address different aspects of the research question, providing a comprehensive framework for the study. Each objective targets a key component necessary for understanding and implementing AI in government operations, ultimately contributing to the successful integration of AI in line with Saudi Arabia's Vision 2030.

1. Analyze Existing Applications of AI in Government Projects Globally: The first objective is to conduct a thorough analysis of how AI is currently being utilized in government projects around the world. This includes studying various case studies, best practices, and success stories from different countries and sectors. By examining these global applications, the study aims to identify common factors that contribute to successful AI implementation and the benefits realized through these projects. This analysis will provide valuable insights into the potential capabilities of AI and set a benchmark for evaluating its application in the Saudi Arabian context.

2. Identify Potential Areas for AI Application in Saudi Arabian Government Projects: Building on the global analysis, the next objective is to identify specific areas within Saudi Arabian government projects where AI can be most effectively applied. This will focus particularly on project and risk management, areas where AI's predictive analytics, automation, and data processing capabilities can offer significant improvements. The study will map out existing processes and highlight opportunities for AI to streamline operations, reduce errors, enhance decision-making, and manage risks more efficiently. Identifying these potential areas will help prioritize efforts and resources towards the most impactful AI applications.

3. Evaluate the Challenges and Opportunities Associated with AI Implementation: Implementing AI in government projects comes with its own set of challenges and opportunities. This objective aims to evaluate these factors in detail, considering technological, organizational, and cultural dimensions. Challenges may include data privacy and security concerns, resistance to change among employees, the need for upskilling, and infrastructure limitations. Conversely, opportunities might encompass enhanced operational efficiency, improved public services, and

better resource management. Understanding these challenges and opportunities is crucial for developing strategies that mitigate risks and leverage AI's full potential.

4. Develop Recommendations for Effective Integration of AI: The final objective is to develop a set of actionable recommendations for the effective integration of AI into Saudi Arabian government project management processes. These recommendations will be informed by the findings from the previous objectives and tailored to the specific context of Saudi Arabia. They will cover a range of aspects including policy frameworks, infrastructure development, workforce training, and stakeholder engagement. The goal is to provide a roadmap that government agencies can follow to successfully adopt AI technologies, ensuring that the integration process is smooth, sustainable, and aligned with the strategic goals of Vision 2030.

Study questions

The study aims to explore the effective application of Artificial Intelligence (AI) in improving project and risk management in Saudi Arabian government projects. To achieve this, the research will address several specific questions aligned with the study's objectives. These questions are designed to provide a comprehensive understanding of AI's potential, identify opportunities and challenges, and develop actionable recommendations for successful AI integration.

1. What successful examples of AI implementation exist in government projects globally for project and risk management?

This question seeks to uncover case studies and examples of how AI has been successfully implemented in government projects around the world. The aim is to analyze different strategies, technologies, and practices that have led to successful outcomes in project and risk management.

2. How can AI be used to improve specific aspects of project and risk management in Saudi Arabian government projects?

This question focuses on identifying the particular areas within Saudi Arabian government projects where AI can make the most significant impact. The research will explore how AI technologies can enhance various aspects of project management, such as scheduling, resource allocation, progress monitoring, and risk assessment.

3. What are the potential challenges associated with AI adoption in Saudi Arabian government projects?

This question aims to identify and evaluate the potential obstacles that may hinder the adoption of AI in Saudi government projects. Challenges could include data availability and quality, ethical considerations, technological infrastructure, resistance to change among employees, and legal and regulatory issues.

4. What are the opportunities presented by AI adoption in Saudi Arabian government projects?

Alongside the challenges, the research will also explore the opportunities that AI adoption presents. This includes potential benefits such as increased efficiency, cost savings, enhanced decision-making, improved transparency, and better resource management.

5. What are the ethical and legal considerations in adopting AI in government projects?

This question addresses the ethical and legal aspects of AI implementation, which are critical for ensuring that AI applications are fair, transparent, and accountable. The research will explore issues related to data privacy, security, algorithmic bias, and the regulatory framework needed to govern AI use in government projects.

6. What recommendations can be made for a successful AI integration strategy for Saudi Arabian government project management?

Based on the findings from the previous questions, this question aims to develop practical and strategic recommendations for integrating AI into Saudi government project management processes. The recommendations will cover various aspects, including policy frameworks, infrastructure development, workforce training, stakeholder engagement, and continuous monitoring and evaluation.

Study hypotheses:

In exploring the potential benefits and challenges of implementing Artificial Intelligence (AI) in project and risk management within Saudi Arabian government projects, several hypotheses can be formulated. These hypotheses aim to provide a structured framework for examining how AI can impact government operations and identify the key factors that may influence its successful adoption. The following detailed hypotheses are aligned with the study's objectives and research questions:

Hypothesis 1: Applying AI to project and risk management in Saudi Arabian government projects can lead to increased efficiency and cost savings.

Rationale: AI technologies, such as machine learning and predictive analytics, have the potential to automate routine tasks, optimize resource allocation, and enhance decision-making processes. By reducing the time and effort required for project management, AI can streamline operations and minimize waste, resulting in significant cost savings. This hypothesis will be tested by analyzing case studies and data from existing AI implementations in government projects, both globally and within Saudi Arabia, to quantify the improvements in efficiency and cost savings.

Hypothesis 2: The lack of skilled personnel and robust data infrastructure in Saudi Arabia may hinder the successful adoption of AI in government projects.

Rationale: Successful AI implementation requires a workforce skilled in AI technologies and data science, as well as a strong data infrastructure to support data collection, storage, and analysis. If Saudi Arabia lacks sufficient trained personnel and a robust data infrastructure, these deficiencies could pose significant barriers to AI adoption. This hypothesis will be tested by evaluating the current state of AI-related education and training programs in Saudi Arabia, as well as the existing data infrastructure, through surveys and interviews with key stakeholders.

Hypothesis 3: AI implementation in Saudi Arabian government projects can improve transparency and accountability in project management.

Rationale: AI can enhance transparency by providing real-time data analytics and insights into project progress, budget allocation, and resource utilization. This increased visibility can help stakeholders monitor project execution more effectively and hold officials accountable for their actions. This hypothesis will be tested by assessing changes in transparency and accountability metrics in government projects where AI has been implemented, using both qualitative and quantitative methods.

Hypothesis 4: Ethical and legal considerations, such as data privacy and algorithmic bias, pose significant challenges to AI adoption in Saudi Arabian government projects.

Rationale: Ethical and legal issues are critical concerns in AI implementation. Data privacy laws, the potential for algorithmic bias, and the need for transparent decision-making processes must be addressed to ensure responsible AI use. This hypothesis will be tested by examining the regulatory framework for AI in Saudi Arabia, analyzing case studies of AI implementation to identify ethical and legal challenges encountered, and conducting interviews with policymakers and legal experts.

Hypothesis 5: AI-driven risk management strategies can significantly reduce the occurrence and impact of project risks in Saudi Arabian government projects.

Rationale: AI's predictive capabilities can be leveraged to identify potential risks early, assess their impact, and develop mitigation strategies. By providing data-driven insights, AI can enhance the accuracy and effectiveness of risk management practices. This hypothesis will be tested by comparing risk management outcomes in AI-augmented projects with those using traditional methods, through statistical analysis of project data and case studies.

Hypothesis 6: Strategic policy frameworks and targeted investments in AI infrastructure can facilitate the successful integration of AI in Saudi Arabian government projects.

Rationale: A supportive policy environment and adequate investment in AI infrastructure are essential for fostering AI adoption. Policies that promote AI research and development, along with investments in necessary infrastructure, can create a conducive environment for AI integration. This hypothesis will be tested by reviewing policy documents, analyzing government investment patterns, and conducting interviews with government officials and industry experts to assess the effectiveness of current strategies.

Previous studies:

The integration of Artificial Intelligence (AI) in government projects, particularly in project and risk management, has been a growing area of interest among researchers and practitioners. This literature review aims to summarize existing research on AI applications in government projects, focusing on studies relevant to project and risk management, highlighting key findings, identifying potential knowledge gaps, and analyzing how these studies inform the research question and objectives.

1. AI in Government Project Management: An Overview

AI technologies have been increasingly adopted in government project management to enhance efficiency, transparency, and decision-making. Studies have shown that AI can automate routine tasks, provide predictive analytics, and optimize resource allocation, which can significantly improve project outcomes (Alhosani & Alhashmi, 2024). For instance, AI-driven tools can help in scheduling, monitoring project progress, and identifying potential bottlenecks, thereby ensuring that projects are completed on time and within budget (Alhosani & Alhashmi, 2024).

Key Findings:

- AI can streamline project management processes by automating repetitive tasks.
- Predictive analytics provided by AI can enhance decision-making and project planning.
- AI tools can optimize resource allocation, reducing waste and improving efficiency.

-

2. AI in Risk Management

Risk management is another critical area where AI has shown significant potential. AI's predictive capabilities can help identify potential risks early, assess their impact, and develop mitigation strategies. Studies by (Alowais et al., 2023) have demonstrated that AI algorithms can analyze historical data to predict future risks and provide real-time alerts. This proactive approach to risk management can prevent project delays, cost overruns, and other adverse outcomes.

Key Findings:

- AI enhances risk identification and assessment through predictive analytics.
- Real-time data analysis by AI can provide early warnings and mitigation strategies.
- AI-driven risk management leads to more proactive and informed decision-making.

3. Case Studies of AI Implementation in Government Projects

Several case studies highlight successful AI implementation in government projects. For example, the City of Los Angeles implemented an AI-based system to improve traffic management. The system uses real-time data from traffic sensors to optimize traffic flow and reduce congestion (Yigitcanlar et al., 2022). Another case is the Singapore Government, which employs AI to manage public housing projects, predicting maintenance needs and optimizing resource allocation (Singhania & Singhania, 2023).

Key Findings:

- AI systems can significantly improve urban infrastructure management.
- Predictive maintenance in public housing projects can optimize resource allocation.
- Real-time data analysis by AI can enhance operational efficiency in government projects.

4. Challenges of AI Implementation in Government Projects

Despite the potential benefits, several studies have highlighted the challenges associated with AI implementation in government projects. These challenges include data privacy concerns, lack of skilled personnel, and the need for robust data infrastructure. (Blanco-González et al., 2023) emphasize that ethical considerations, such as algorithmic bias and transparency, are critical issues that need to be addressed. Additionally, the resistance to change among government employees can hinder the successful adoption of AI technologies.

Key Findings:

- Data privacy and security are major concerns in AI implementation.
- The shortage of skilled AI professionals can impede AI adoption.
- Ethical issues, such as algorithmic bias, must be addressed to ensure fair and transparent AI systems.

5. Potential Benefits of AI in Government Projects

The potential benefits of AI in government projects are well-documented. AI can enhance transparency by providing real-time insights into project status, budget allocation, and resource utilization. This increased visibility can help stakeholders monitor project progress and hold officials accountable. AI can also improve public service delivery by optimizing operations and providing personalized services to citizens (Nguyen et al., 2022).

Key Findings:

- AI improves transparency and accountability in government projects.
- Enhanced public service delivery through optimized operations and personalized services.
- Real-time insights from AI can facilitate better project monitoring and evaluation.

6. Identifying Gaps in Knowledge

While existing studies provide valuable insights into AI applications in government projects, several gaps remain. First, there is limited research on the specific application of AI in Saudi Arabian government projects. Most studies focus on Western countries or developed economies, which may have different contexts and challenges compared to Saudi Arabia. Second, there is a lack of comprehensive frameworks for integrating AI into project and risk management processes. Many studies highlight the potential benefits and challenges but do not provide detailed implementation strategies. Lastly, there is a need for more empirical research to validate the theoretical benefits of AI in government projects (Straub et al., 2023).

Key Findings:

- Limited research on AI applications in Saudi Arabian government projects.
- Need for comprehensive frameworks for AI integration in project and risk management.
- More empirical studies are needed to validate theoretical benefits.

7. Informing the Research Question and Objectives

The findings from these studies directly inform the research question and objectives of this study. By understanding the global best practices and successful examples of AI implementation, the study can identify specific strategies that can be adapted to the Saudi Arabian context. The challenges highlighted in the literature, such as data privacy and the lack of skilled personnel, will guide the research in identifying potential barriers and developing solutions to overcome them.

The review of benefits and opportunities underscores the importance of AI in enhancing efficiency, transparency, and decision-making in government projects. These insights will help in formulating specific recommendations for effective AI integration in Saudi Arabian government project management processes. The identified knowledge gaps, particularly the lack of research in the Saudi context, emphasize the need for this study to fill these gaps and provide context-specific insights.

Theoretical principles of the study:

To comprehensively understand the potential impact of Artificial Intelligence (AI) on government projects, it is crucial to delve into several theoretical frameworks and methodologies that underpin AI, project management, and risk management. This section discusses relevant theories and frameworks, providing a robust foundation for examining AI's transformative potential in the context of government projects.

1. Artificial Intelligence Theory

Artificial Intelligence (AI) is a branch of computer science focused on creating systems capable of performing tasks that typically require human intelligence. This includes a wide array of functions such as learning, reasoning, problem-solving, perception, and language understanding (What Is AI (Artificial Intelligence)?, 2024b). The basic concepts of AI can be understood through several key components:

- **Machine Learning (ML):** A subset of AI that involves training algorithms to make predictions or decisions based on data. Techniques include supervised learning, unsupervised learning, and reinforcement learning.
- **Natural Language Processing (NLP):** A field of AI that enables computers to understand, interpret, and generate human language. Applications include chatbots, language translation, and sentiment analysis.
- **Computer Vision:** A domain that involves teaching machines to interpret and understand visual information from the world. This includes image recognition, video analysis, and facial recognition.

AI's potential applications in government projects are vast. For instance, AI can automate routine tasks, provide predictive analytics, optimize resource allocation, and enhance decision-making processes. By leveraging AI, governments can streamline operations, reduce costs, and improve service delivery (Hjaltalin & Sigurdarson, 2024).

2. Project Management Methodologies

Project management methodologies provide structured approaches to planning, executing, and completing projects. Several methodologies are widely used in various industries, each with its strengths and weaknesses. Understanding these methodologies helps in exploring how AI can complement and enhance traditional project management practices (Tarver, 2024).

Agile Project Management:

Overview: Agile is an iterative and incremental approach to project management that emphasizes flexibility, collaboration, and customer satisfaction. It involves breaking the project into small, manageable units of work called sprints (Dong et al., 2024)

AI Integration: AI can enhance Agile practices by providing real-time data analytics and predictive insights. For example, AI tools can analyze project data to forecast potential delays and suggest adjustments to the project plan. AI-powered task management systems can automate the allocation of tasks based on team members' skills and availability, improving efficiency and productivity (Dhakshinadhi, 2024)

Waterfall Project Management:

Overview: The Waterfall model is a linear and sequential approach where each phase of the project must be completed before moving on to the next. It is suitable for projects with well-defined requirements and stable conditions (Lima, 2023).

AI Integration: In Waterfall projects, AI can be used to optimize resource allocation and monitor project progress. AI algorithms can predict resource needs and identify potential risks early in the project lifecycle. Automated reporting tools can provide real-time updates on project status, ensuring that project managers have accurate and timely information to make informed decisions (Lima, 2023)

Hybrid Project Management:

Overview: A hybrid approach combines elements of both Agile and Waterfall methodologies to leverage the strengths of each. It is particularly useful for projects that require flexibility in some phases and a structured approach in others (Beister & Zeljkovic, 2021)

AI Integration: AI can support hybrid project management by providing adaptive tools that adjust to the needs of different project phases. For example, during the planning phase, AI can assist with detailed scheduling and resource allocation. During the execution phase, AI can facilitate real-time adjustments and continuous improvement based on project data (Beister & Zeljkovic, 2021)

3. Risk Management Frameworks

Risk management frameworks provide systematic approaches to identifying, assessing, and mitigating risks. These frameworks are essential for ensuring that projects are completed successfully, within budget, and on time. AI can significantly enhance risk management processes by providing advanced predictive analytics and real-time monitoring capabilities.

Failure Modes and Effects Analysis (FMEA):

Overview: FMEA is a proactive risk management technique used to identify potential failure modes in a system, assess their impact, and prioritize actions to mitigate risks. It involves analyzing each component of a system to determine how it might fail and the potential consequences of those failures (El-Awady, 2023)

AI Integration: AI can automate and enhance FMEA by analyzing large datasets to identify patterns and predict potential failures. Machine learning algorithms can continuously learn from historical data and real-time inputs, improving the accuracy of risk assessments. AI-powered tools can also prioritize risks based on their likelihood and impact, providing actionable insights for risk mitigation strategies (El-Awady, 2023)

ISO 31000:

Overview: ISO 31000 is an international standard for risk management that provides guidelines and principles for managing risks effectively. It emphasizes the importance of integrating risk management into organizational processes and decision-making (Makajić-Nikolić, 2020)

AI Integration: AI can support ISO 31000 implementation by providing advanced data analytics and real-time risk monitoring. AI tools can automate risk assessments, identify emerging risks, and provide continuous updates on risk status. This enables organizations to respond more quickly to changing risk environments and make informed decisions (Makajić-Nikolić, 2020)

4. Integrating AI with Theoretical Frameworks

Integrating AI with existing theoretical frameworks for project and risk management can provide significant benefits. AI's ability to process and analyze large volumes of data quickly and accurately can enhance traditional methodologies and frameworks, making them more effective and efficient.

Enhancing Decision-Making: AI's predictive analytics capabilities can provide project managers with valuable insights into potential issues and opportunities. By analyzing historical data and real-time inputs, AI can identify trends and patterns that may not be apparent to human analysts. This enables project managers to make more informed decisions and take proactive measures to mitigate risks and optimize resources (Yelne et al., 2023).

Improving Efficiency: AI can automate routine tasks and processes, reducing the time and effort required for project and risk management. For example, AI-powered tools can automatically generate project schedules, allocate resources, and monitor progress. This frees up project managers to focus on more strategic tasks and improves overall project efficiency (Hassan, 2024).

Enhancing Collaboration: AI can facilitate better collaboration among project team members by providing real-time data and insights. AI-powered collaboration tools can help team members stay informed about project status, share updates, and communicate more effectively. This enhances teamwork and ensures that everyone is working towards common goals (Nagraj, 2023).

Increasing Transparency: AI can improve transparency in project and risk management by providing real-time data and insights into project status and risk factors. AI-powered dashboards and reporting tools can provide stakeholders with a clear and accurate view of project progress, budget allocation, and resource utilization. This enhances accountability and ensures that stakeholders are informed and engaged (Li et al., 2024).

Methodology and research methods:

Chosen Methodology: Secondary Research Method - Mixed Method

The chosen methodology for this study is a mixed-method approach using secondary research. This approach involves collecting and analyzing both qualitative and quantitative data to gain a comprehensive understanding of how Artificial Intelligence (AI) can be applied to improve project and risk management in Saudi Arabian government projects. By leveraging existing information

from various sources, the study aims to provide a holistic view of the current landscape, potential benefits, challenges, and strategic recommendations for AI integration.

Justification for the Mixed Method Approach

A mixed-method approach is suitable for this study because it combines the strengths of both qualitative and quantitative data analysis, offering a more nuanced and thorough understanding of the research problem. Qualitative data provides depth and context, allowing for an exploration of the intricacies and subtleties associated with AI implementation in government projects. It helps in understanding the subjective experiences, opinions, and motivations of various stakeholders. On the other hand, quantitative data offers the ability to measure and analyze trends, patterns, and correlations statistically. This dual approach ensures that the research captures both the detailed insights and the broader trends necessary for comprehensive analysis.

Specific Data Collection Methods

Qualitative research is the type of research used for exploring and describing the meanings perspective and experience of individuals as well as groups through non-numerical data. Gaining a detailed understanding of the research context collecting valuable, verified and authentic data, flexibility in approach as well as consideration of context are considered as the advantages of qualitative research. this method works well for delicate subjects, theory building, as well as exploratory research. According to Yadav (2020), Qualitative research is also capable of yielding emerging themes and patterns, enable participant participation and interaction, and be less expensive. Along with that, the author also stated, qualitative research is a useful methodological technique since it provides a detailed knowledge of complicated phenomena.

Qualitative Data Collection:

Method	Description	Sources
Academic Journals	Reviewing scholarly articles that discuss AI applications in project and risk management, particularly within the context of government projects.	Public Administration, Information Technology, Project Management journals
Reports	Analyzing reports from international organizations, think tanks, and consultancy	World Bank, McKinsey, Deloitte

Method	Description	Sources
	firms that provide insights into global best practices and case studies of AI implementation in government projects.	
Government Documents	Examining strategic plans, policy documents, and official statements from Saudi government bodies, including the Saudi Data and Artificial Intelligence Authority (SDAIA), to understand the current state and future plans for AI adoption.	SDAIA website, Ministry of Finance, Ministry of Communications and Information Technology
News Articles	Reviewing news articles that report on AI initiatives in Saudi Arabia and other countries, highlighting successes, challenges, and public perceptions.	Local newspapers (e.g., Saudi Gazette, Arab News), International news agencies (e.g., BBC, Reuters)

Quantitative Data Collection:

Observations, focus groups, questionnaires, interviews, and other non-numerical approaches are used in qualitative data collecting to elicit detailed information on attitudes, behaviors, and experiences. As per Mohajan (2020), this method works especially well for deciphering complicated occurrences, investigating novel concepts, and recognizing themes and patterns. Benefits include collecting detailed, nuanced data, building rapport and trust with participants, and facilitating exploratory research that might help create theories.

Data Source	Description	Variables	Data Type
Survey	Gathering data from project managers and stakeholders through online	Perceptions of AI integration effectiveness, challenges faced, benefits realized, and suggestions for improvement	Numerical/Ordinal

Data Source	Description	Variables	Data Type
	surveys		

Data Analysis Plan

Qualitative Data Analysis:

1. **Thematic Analysis:** This method will be used to identify, analyze, and report patterns (themes) within qualitative data. It involves coding the data, identifying significant themes, and interpreting the meaning of these themes in relation to the research questions.
2. **Content Analysis:** A systematic approach to analyzing text data from academic journals, reports, government documents, and news articles. This will involve categorizing information into key themes and trends related to AI applications, benefits, challenges, and strategic recommendations.

Quantitative Data Analysis:

In order to start quantitative data analysis, first a set of questionnaires have been formed, based on which the below mentioned tests will be performed.

Demographic Questions

Question #	Question	Response Options
1	Job Title	a) Manager, b) Engineer, c) Consultant, d) Other (please specify)
2	Experience in Project Management	a) Less than 2 years, b) 2-5 years, c) 5-10 years, d) More than 10 years
3	Level of Education	a) Bachelor's degree, b) Master's degree, c) Ph.D., d) Other (please specify)
4	Department/Ministry	a) Ministry of Education, b) Ministry of Health, c) Ministry of Transportation, d) Ministry of Finance, e) Other (please specify)

Question #	Question	Response Options
5	City	a) Riyadh, b) Jeddah, c) Khobar, d) Other (please specify)

Likert Scale Questions

Question #	Question	Scale
6	I am familiar with the concept of Artificial Intelligence (AI).	1= Strongly Disagree, 2= Somewhat Disagree, 3= Neutral, 4= Somewhat Agree, 5= Strongly Agree
7	I believe that AI can improve project management efficiency in our government projects.	1-5
8	Our organization has implemented AI-based project management tools to date.	1= Strongly Disagree, 2= Somewhat Disagree, 3= Neutral, 4= Somewhat Agree, 5= Strongly Agree
9	I think AI-based project management tools are essential for our government projects.	1-5
10	The lack of AI-based project management tools hinders our ability to deliver projects on time and within budget.	1-5
11	I am willing to adopt AI-based project management tools in our government projects.	1-5
12	Our organization has the necessary resources to implement AI-based project management tools.	1= Strongly Disagree, 2= Somewhat Disagree, 3= Neutral, 4= Somewhat Agree, 5= Strongly Agree
13	I think AI-based resource allocation tools can help us optimize resource utilization in our government projects.	1-5

Question #	Question	Scale
14	The implementation of AI-based resource allocation tools would require significant changes to our current workflows and processes.	1-5
15	I believe that AI-based project management and resource allocation tools can improve collaboration among team members in our government projects.	1-5
16	Our organization has experienced challenges in implementing AI-based project management and resource allocation tools in the past.	1= Strongly Disagree, 2= Somewhat Disagree, 3= Neutral, 4= Somewhat Agree, 5= Strongly Agree
17	I think the benefits of AI-based project management and resource allocation tools outweigh the costs and challenges associated with their implementation.	1-5
18	Our organization should prioritize the adoption of AI-based project management and resource allocation tools in the next year.	1-5
19	I am confident that AI-based project management and resource allocation tools can improve the overall performance of our government projects.	1-5
20	The adoption of AI-based project management and resource allocation tools will lead to increased efficiency and effectiveness in our government projects.	1-5

Note: The scale ranges from "Strongly Disagree" (1) to "Strongly Agree" (5), with "Neutral" (3) being the middle point.

Statistical tests

1. **Descriptive Statistics:** Using statistical methods to describe the basic features of the data. This includes calculating means, medians, variances, and frequencies to summarize the performance indicators of project and risk management.

2. **Inferential Statistics:** Employing statistical techniques such as correlation analysis, regression analysis, and hypothesis testing to identify relationships and draw conclusions from the data. This can help determine the impact of AI on various aspects of project and risk management.
3. **Regression:** Along with that, the researcher will also conduct a regression analysis in order to test the hypothesis of the study. According to Skiera, Reiner, & Albers (2021), as it allows for the investigation of correlations between variables, the adjustment of confounding variables, and the estimation of coefficients, regression analysis is considered an essential tool in hypothesis testing. It is an essential tool in many disciplines, including the social sciences, economics, and medical, since it aids in testing assumptions about slopes, intercepts, and R-squared values.

Limitations of the Chosen Methods and Data Availability

While the mixed-method approach provides a comprehensive understanding of the research problem, there are several limitations associated with this methodology and data availability.

1. **Data Availability:** The availability and accessibility of quantitative data sets specific to Saudi Arabian government projects may be limited. Government data may not be publicly available due to privacy concerns, security issues, or lack of digitization. This limitation can restrict the depth and scope of quantitative analysis.
2. **Data Quality:** The reliability and validity of secondary data can vary. There may be inconsistencies, gaps, or biases in the data sources used for analysis. Ensuring the credibility of the sources and triangulating data from multiple sources can mitigate this issue but may not eliminate it entirely.
3. **Generalizability:** The findings from secondary data analysis may not be entirely generalizable to all contexts within Saudi Arabia or other regions. The specific political, economic, and cultural context of Saudi Arabia may influence the applicability of global best practices and case studies.
4. **Subjectivity in Qualitative Analysis:** Qualitative data analysis involves interpretative processes that can be subjective. The researcher's biases and perspectives may influence the coding and interpretation of themes. Ensuring transparency in the analysis process and using multiple coders can help mitigate this issue.
5. **Time and Resource Constraints:** Conducting a comprehensive review of existing literature and data analysis requires significant time and resources. Limitations in these areas may impact the breadth and depth of the research.

6. **Rapid Technological Changes:** AI is a rapidly evolving field, and new developments may occur during the course of the study. Keeping the research updated with the latest advancements and trends can be challenging.

Despite these limitations, the mixed-method approach remains a robust and effective methodology for exploring the potential of AI in improving project and risk management in Saudi Arabian government projects. By combining qualitative and quantitative data, the study aims to provide a well-rounded analysis that captures both detailed insights and broader trends, ultimately contributing to the successful integration of AI in line with Vision 2030 goals.

Study tools:

Tool Type	Tool Name	Description	Data Type
Online Databases	Google Scholar	Academic journals and articles on AI applications in project and risk management	Quantitative
Online Databases	IEEE Xplore	Research articles and conference papers on AI methodologies in engineering and technology fields	Quantitative
Online Databases	JSTOR	Scholarly articles and journals on historical and theoretical perspectives on project and risk management	Qualitative/Quantitative
Government Websites	Saudi Data and Artificial Intelligence Authority (SDAIA)	Official documents, reports, and strategic plans on AI initiatives in Saudi Arabia	Quantitative
Government Websites	Ministry of Finance, Saudi Arabia	Government project funding, budget allocations, and financial reports	Quantitative
Government	Saudi Vision 2030	Detailed information on	Quantitative

Tool Type	Tool Name	Description	Data Type
Websites	Website	Vision 2030 initiatives, progress reports, and strategic goals	
Reports and Publications	Consultancy Firms (e.g., McKinsey, PwC, Deloitte)	Industry reports and whitepapers on AI applications and best practices in project management	Quantitative
Reports and Publications	International Organizations (e.g., World Bank, United Nations)	Publications and case studies on AI implementations in government projects globally	Quantitative
News Articles	News Aggregators (e.g., Google News, Bloomberg)	Articles and updates on recent AI projects and government initiatives in Saudi Arabia and other countries	Qualitative
Software and Data Analysis Tools	NVivo	Qualitative data analysis software for coding and identifying themes in textual data	Qualitative
Software and Data Analysis Tools	SPSS (Statistical Package for the Social Sciences)	Quantitative data analysis software for conducting descriptive and inferential statistical analysis	Quantitative

border the study:

Scope of the Research

The scope of this research is focused on exploring how Artificial Intelligence (AI) can be applied to enhance project and risk management within Saudi Arabian government projects. By narrowing the focus to specific aspects of AI applications, the study aims to provide detailed insights and practical recommendations relevant to the targeted areas.

Focus on Project and Risk Management

The primary emphasis of the study is on project and risk management aspects of AI applications. This includes analyzing how AI technologies can improve project scheduling, resource allocation, progress monitoring, risk identification, and risk mitigation. The study will not cover other areas of AI applications such as AI in healthcare or AI for public safety, ensuring a concentrated examination of the chosen domains.

Limitation to Specific Government Project Types

Due to word count limitations and the need for a focused analysis, the study will be limited to specific types of government projects. This will include large-scale infrastructure projects, public transportation initiatives, and urban development projects. These project types are selected because they typically involve significant project management and risk management challenges, making them ideal candidates for AI integration.

Geographical and Temporal Limitations

Geographical Limitation: The study is geographically limited to Saudi Arabia. By focusing on the Saudi Arabian context, the research can provide specific recommendations that are culturally and administratively relevant to the country. This geographical focus also aligns with the strategic goals of Vision 2030.

Temporal Limitation: The research will primarily focus on recent government projects, particularly those initiated within the last decade. This temporal limitation ensures that the study considers the latest developments in AI technology and recent trends in project and risk management. Focusing on contemporary projects allows for the assessment of current practices and the potential for immediate AI integration.

Conclusion

In conclusion, the reviewer plays a crucial role in the research process, particularly in studies that involve complex and interdisciplinary topics like the application of AI in government project management. Their expertise, critical evaluation, and constructive feedback ensure that the research meets high academic standards and provides valuable contributions to the field. For this study, the reviewer's role is essential in validating the research findings and ensuring that the recommendations for AI integration in Saudi Arabian government projects are both feasible and impactful.
