Date of submission:	21-Feb-2024

Introduction:

Online education has gained immense popularity in recent years due to the advances in technology and the growing accessibility of the internet. This form of education, also known as e-learning, virtual learning, or distance learning, allows students and teachers to engage in a learning experience without being physically present in a traditional classroom setting. With the rise of online education, it has become crucial to examine its effectiveness and impact on students, teachers, and the education system as a whole.

Research problem:

The main problem addressed in this paper is whether online education provides the same quality of education as traditional classroom learning. While online education has been widely adopted, there is still skepticism surrounding its effectiveness, especially in comparison to traditional classroom learning. Therefore, it is essential to understand the current state of online education and its impact on students and teachers.

Research significance:

The significance of this study lies in addressing the growing trend of online education and its potential to transform the education system. With the outbreak of the COVID-19 pandemic, the adoption of online education has accelerated, making it a vital topic of research. Understanding the effectiveness of online education can provide insights for educators and policymakers to improve the delivery of education in a digital era.
