Research title

The Social Effect of Hiring Females in Executive Positions in Saudi Arabia

Introduction

In recent years, the topic of gender equality and women's empowerment has gained significant attention worldwide. Examining the place of women in numerous fields, particularly executive roles, is critical as societies work towards growth and inclusiveness. The hiring of women in high-level roles has undergone a paradigm change recently in Saudi Arabia, a conservative country with deeply rooted cultural norms and traditions. This study project seeks to provide light on the ramifications for both individuals and society at large of recruiting women in senior positions in Saudi Arabia.

Saudi Arabia's decision to allow women to hold executive roles marks a significant break from the long-standing patriarchal system that has dominated the nation's workforce. Saudi Arabian culture has always been ruled by tight gender segregation, with little possibilities for women to engage in public life (Alshoaibi., 2018). However, as part of its Vision 2030 programme, which aims to restructure the country's economy and advance social progress, the Kingdom has recently started a number of ambitious reforms. The rising focus on gender equality and women's empowerment, especially in professional contexts, is a crucial component of this strategy.

The representation of women in executive roles has significantly changed as a result of this mentality shift. Organizations in Saudi Arabia are aggressively recruiting and elevating skilled women to leadership positions as they come to understand the advantages of diversity and inclusion. This phenomenon comes at a critical juncture in the social and economic history of the

nation, when gender norms are being questioned and chances for women to participate in decision-making are growing (Tlaiss & Waqfi., 2022).

The purpose for conducting this study stems from the recognition of the significance of comprehending the societal effects that come along with the inclusion of women in executive jobs in Saudi Arabia. Despite the fact that there is an expanding corpus of study on gender diversity in leadership roles around the globe, the distinctive socio-cultural setting of Saudi Arabia calls for a particular attention. This study seeks to add to the body of knowledge by examining the societal impacts of recruiting women for senior positions and to offer insights that can guide practices and policies in Saudi Arabia and other nations going through comparable changes.

The research will address several key issues and sub-problems. Firstly, it will examine the barriers and challenges faced by women in accessing and progressing within executive positions in Saudi Arabia, taking into account cultural norms, legal frameworks, and organizational practices. Barkhuizen et al. (2022) contend that cultural norms that are based on conventional gender roles and expectations might be very difficult for women who want to hold leadership positions. Additionally, current organizational norms and legal frameworks may unintentionally support gender prejudices and impede women's professional advancement. For measures to promote the fair representation of women in executive posts, it is essential to understand these obstacles.

Second, the study will investigate the effects of gender diversity in executive posts on corporate culture, worker satisfaction, and output. Research by Kaur & Arora. (2020), has shown that diverse teams, including gender diversity, can foster creativity, innovation, and better decision-making. Insights into the potential advantages and difficulties of gender diversity may be gained by looking at how the presence of women in executive roles affects the overall organizational culture and dynamics.

Additionally, the study will examine how male colleagues and subordinates view female leaders, evaluating attitudes, prejudices, and preconceptions that could affect workplace dynamics. The opinions of a leader's efficacy can be shaped by gender prejudices and preconceptions, which might impede women's career progress. The study seeks to emphasize the significance of breaking stereotypes and establishing gender-inclusive work cultures by examining the prevalent attitudes towards female leaders and identifying possible areas for development (Opoku & Williams., 2019).

The study will also examine how recruiting women for executive roles may have larger social effects, such as the possibility of cultural transformation and the empowerment of women in Saudi Arabian culture. Younger generations might look forward to women in executive roles as role models, challenging society conventions and motivating other women to seek careers in leadership. Additionally, Saudi Arabian culture may face changes in gender norms as a result of encouraging women to assume prominent roles, resulting in better gender equality and socioeconomic advancement (Byrne et al., 2019).

The topic of hiring women in executive positions in Saudi Arabia holds significant relevance to the broader field of social sciences and gender studies. This study intends to further knowledge of gender dynamics, organizational behavior, and societal development in a particular cultural environment by looking at the social repercussions of this phenomena. The results of this study may influence future programmers, legislation, and research projects that support gender equality and women's empowerment in Saudi Arabia and beyond.

Furthermore, the research aligns with the goals of the global movement towards achieving the United Nations' Sustainable Development Goals (SDGs), particularly Goal 5: Gender Equality (Note., 2020). This research adds to the body of knowledge necessary for developing evidence-

based plans and interventions to enhance gender equality in many aspects of society by examining the societal benefits of appointing women in executive roles.

In conclusion, this research proposal seeks to investigate the social effects of hiring women in executive positions in Saudi Arabia. The goal of the research is to further social development in a society that is going through considerable change by examining the obstacles, effects, and wider implications of this phenomena. By addressing the major problems and their subproblems, this study will add to the body of knowledge and provide guidance for practices and policies that support gender equality and women's empowerment.

Research problem

1. What are the social effects of hiring females in executive positions in Saudi Arabia?
2. What are the barriers and challenges faced by women in accessing and progressing within executive positions in Saudi Arabia?
3. How does the inclusion of women in executive roles impact organizational culture, employee morale, and productivity in Saudi Arabian companies?
4. What are the prevailing attitudes, biases, and stereotypes towards female leaders among their male counterparts and subordinates in Saudi Arabian organizations?
5. What are the broader societal implications of hiring women in executive positions, such as role modeling, societal change, and women's empowerment, in Saudi Arabian society?

Research objectives

1. To examine the barriers and challenges faced by women in accessing and progressing within executive positions in Saudi Arabia.

2. To assess the impact of hiring women in executive roles on organizational culture, employee morale, and productivity in Saudi Arabian companies.
3. To explore the prevailing attitudes, biases, and stereotypes towards female leaders among their male counterparts and subordinates in Saudi Arabian organizations.
4. To investigate the broader societal implications of hiring women in executive positions, including role modeling, societal change, and women's empowerment in Saudi Arabian society.
5. To provide recommendations and insights that can inform policies and practices aimed at promoting gender equality and women's empowerment in executive positions in Saudi Arabia.

Importance of the study

The research topic holds significant importance in several aspects. To begin with, knowing the dynamics and effects of gender diversity in leadership roles is more important than studying other subjects for developing inclusive workplaces and gender equality. Studying the particular setting of Saudi Arabia offers important insights into the difficulties and chances for women's progress in a historically conservative nation. The underrepresentation of women in executive roles is a widespread issue globally.

Additionally, the research is significant for several societal groups. The study gives women who want to become executives a greater grasp of the obstacles they can encounter and the tactics that might help them advance in their careers. The findings can influence Saudi Arabian organizations' policies and practices that support gender diversity, strengthen organizational culture, and increase output. This study also provides policymakers and government organizations with information about the societal effects and possible advantages of having more women in leadership roles.

This research will contribute to the existing body of knowledge in the fields of gender studies, organizational behavior, and social sciences. The study gives theoretical insights into the implications of gender diversity on organizational dynamics, employee attitudes, and society norms by examining the social effects of recruiting women in senior roles in Saudi Arabia. The results can contribute to the development and expansion of current ideas on gender and leadership and offer a more nuanced understanding of the challenges to attaining gender equality in the workplace.

This research will inform policies and practices that promote gender equality and women's empowerment in executive positions in Saudi Arabia. By identifying the barriers faced by women and understanding their impact on organizational culture and employee morale, organizations can develop targeted interventions to foster a more inclusive and equitable workplace. The findings can guide the implementation of diversity and inclusion initiatives, mentoring programs, and leadership development strategies that empower women and enhance organizational performance.

Research hypothesis

Hypothesis 1:

There is a significant negative relationship between cultural barriers and the access and progression of women within executive positions in Saudi Arabia. Higher levels of cultural barriers will be associated with lower representation of women in executive roles.

Hypothesis 2:

The inclusion of women in executive positions positively influences organizational culture, employee morale, and productivity in Saudi Arabian companies. Organizations with higher

representation of women in executive roles will exhibit more inclusive and supportive cultures, higher employee morale, and increased productivity.

Hypothesis 3:

There is a significant correlation between prevailing attitudes, biases, and stereotypes towards female leaders and the experiences and perceptions of women in executive positions in Saudi Arabian organizations

Literature review

Numerous studies have examined the barriers and challenges faced by women in accessing and progressing within executive positions in Saudi Arabia. Research indicates that cultural norms, gender stereotypes, and societal expectations pose significant obstacles for women aspiring to leadership roles (Alqahtani., 2019). Traditional gender roles, limited access to mentorship and networking opportunities, and perceived lack of family support have been identified as key factors

hindering women's career advancement. Additionally, legal frameworks and organizational practices have been found to perpetuate gender biases and limit opportunities for women to reach executive positions (Castaño et al., 2019).

Research on the impact of hiring women in executive positions in Saudi Arabian companies highlights both the organizational and individual-level effects. According to studies, gender diversity in leadership positions fosters more inclusion, cooperation, and creativity within organizations (Brimhall & Mor., 2018). Employee engagement, job happiness, and organizational commitment have all increased when there are more women in senior positions. Additionally, studies show that leadership teams with a diversity of genders are more likely to create superior financial results and competitive advantage.

Studies looking at opinions of female leaders in Saudi Arabian organizations have found that there are both discriminating and supportive attitudes. According to some study, attitudes towards female leaders are improving, with a greater appreciation of their talents and accomplishments (Zhang et al., 2023). The prevalence of gender prejudices and preconceptions, particularly the idea that women lack leadership skills and struggle with assertiveness and confidence, is also made clear by research. These prejudices have the potential to affect how women are treated in the workplace and their chances for career progression (Chang & Milkman., 2020).

Hiring women for top roles in Saudi Arabia has impact on society that go beyond organizational lines. The value of role models, the possibility for societal transformation, and the potential for women's empowerment are all highlighted by research. Younger generations look up to women in executive positions as role models, who dismantle gender stereotypes and encourage other women to get into business for themselves (Meeussen et al., 2020). The increased visibility and influence of women in executive positions can contribute to changing societal

perceptions of gender roles and promote gender equality in Saudi Arabian society (Syed et al., 2020).

In conclusion, previous studies have provided valuable insights into the social effects of hiring females in executive positions in Saudi Arabia. They have outlined the obstacles and difficulties that women encounter, looked at how gender diversity affects organizational culture and employee results, investigated perceptions and prejudices towards female leaders, and spoken about the larger societal repercussions of women holding executive positions. To better understand gender dynamics, organizational behavior, and women's empowerment in the context of Saudi Arabian culture, more study is still required to go further into specific issues.

Research Methodology

The selected research method for the study on the social effect of hiring females in executive positions in Saudi Arabia is the Descriptive Method. Using the descriptive method, phenomena, traits, or behaviors are methodically described and analyzed. Without attempting to prove causation, it tries to offer an accurate and thorough depiction of the study issue. Mohajan (2018) claims that this approach is appropriate for the study because it enables the data to be gathered through surveys, interviews, and observations to learn about the obstacles, organizational dynamics, attitudes, and societal implications related to women in executive positions in Saudi Arabian organizations.

Using the Descriptive Method, the researcher can employ surveys to collect quantitative data on the representation of women in executive positions, organizational culture, and employee perceptions (Schmiedel et al., 2019). Additionally, qualitative techniques like observations and interviews can offer deep insights into the perceptions, prejudices, and preconceptions that exist

around the experiences of women in executive jobs. These methods of data collecting will make it possible to fully comprehend the existing situation and shed light on the societal implications of employing women for executive roles. The study's use of the descriptive method can yield insightful results and add to our understanding of gender diversity and women's empowerment in Saudi Arabian organizations. The results can influence executive positions' inclusive work environments and policies, practices, and actions that advance gender equality.

Research Structure

The research study on the social effect of hiring females in executive positions in Saudi Arabia will follow a structured framework to ensure a systematic and comprehensive investigation. The research structure will consist of several key components.

Introduction: A summary of the research topic, the study's goals, and its significance will be given in the introduction, which will be the first chapter of the study. It will provide background information for the study and describe its objectives and importance.

Literature Review: A thorough literature review will be conducted to examine existing studies and research conducted on the topic. It will identify the gaps in knowledge, highlight key findings, and establish the foundation for the current study.

Research Methodology: The chosen research technique, in this case the descriptive approach, will be described in the research methodology section. In order to achieve the study objectives, it will discuss the data collection methods, sample selection criteria, and data analysis processes used.

Data Collection and Analysis: This section will detail the process of data collection, including surveys, interviews, and observations. It will explain how the collected data will be analyzed using appropriate statistical methods and qualitative analysis techniques to derive meaningful insights.

Results and Findings: The data will be presented and thoroughly analyzed in the results and findings section along with the study findings. Each study goal will be covered, and the ramifications of the results will be discussed in regard to the societal impact of recruiting women for senior positions in Saudi Arabia.

Discussion and Interpretation: In the framework of already-existing literature and ideas, this section will interpret the research findings. It will examine the conclusions' ramifications, importance, and restrictions and talk about their theoretical and practical consequences.

Conclusion: The study's conclusion will include a summary of the major results, a restatement of the study's goals, and suggestions for more analysis and practical applications.

Research limits

One limitation of the research study is related to sample size and representativeness. It might not be possible to include a sizable and varied sample of women in executive roles due to practical limitations. The generalizability of the findings to a larger population of Saudi Arabian women in executive jobs may be hampered by this constraint. It is important to recognize that the study's sample may not accurately reflect the variety of viewpoints and experiences held by women in executive roles, thereby reducing the findings' applicability to other contexts.

Another limitation stems from the data collection methods employed. Surveys, interviews, and observations have inherent limitations, including potential response biases, social desirability biases, and subjectivity in interpreting observations. These constraints may have an effect on the accuracy and dependability of the data gathered. Researchers should be aware of these possible biases and take precautions to reduce them, including maintaining anonymity and confidentiality

in surveys, using a variety of interview methodologies, and using strict coding and analytic procedures to reduce subjectivity.

Another constraint is posed by Saudi Arabia's cultural environment. It's possible that other cultural contexts or nations with distinct social and cultural norms won't be able to immediately apply the research study's conclusions. The experiences of women in executive roles may be influenced by the distinctive social context of Saudi Arabia. Therefore, care should be used when extrapolating the findings outside of Saudi Arabia's unique cultural environment.

Lastly, time and resource constraints can impact the research study. Limited timeframes and resources may result in compromises, such as a smaller sample size, restricted geographical coverage, or limitations in the depth of data analysis (Nyumba et al., 2018). It is important to acknowledge these constraints to set realistic expectations and ensure that the findings are interpreted within the scope of the available resources. By recognizing and addressing these limitations, researchers can provide a comprehensive and transparent account of the study's findings. It is crucial to understand the potential constraints and consider their implications when interpreting and generalizing the results, as well as in designing future research studies on the social effects of hiring females in executive positions in Saudi Arabia.
