AI in project management is still in its early developmental stages, facing significant challenges in the design and implementation of tools, especially at the practical level. This field often remains theoretical or is challenging to apply effectively in current practices. This may be due to various factors affecting the development and use of AI tools in project management, leading to a lack of clear and actionable outputs in realworld scenarios. “Although AI-enabled PM seems encouraging, its design, standardization, and implementation in project-based firms are still a challenge.

I did not notice the inclusion of any exploratory study in the first chapter. Additionally, I did not find a statistical equation that could help determine the study sample based on the study population.
