1. Chapter 1: Introduction

1.1. Research Background

Is remote work a blessing or a curse?

remote work is when people work from a location other than a traditional office, usually their home. They use technology like computers, phones, and the internet to connect with their workplace and complete their job duties.¹

Telecommuting started gaining popularity in the 1970s and 1980s due to advancements in technology, like personal computers and the internet. However, it wasn't until the widespread adoption of broadband internet in the late 1990s and early 2000s that telecommuting became a viable option for many people.

COVID-19 had a huge impact on the increase of remote work.

Before the pandemic, telecommuting was becoming more common, but it wasn't as widespread as it is now. When COVID-19 happened, many businesses had to close their offices to keep people safe. This forced companies to quickly adapt and allow their employees to work from home.

Because of this sudden shift, remote work became the norm for many people. Even after the worst of the pandemic passed, many companies realized that remote work could be beneficial, so they continued to offer it as an option.²

Remote work offers many benefits. Flexible work hours and no commute time can improve physical and mental health. Working from home without distractions can boost productivity. Remote workers often have more control over their work,

¹Al-Habaibeh, A., Watkins, M., Waried, K., & Bathaei Javareshk, M. (2021). Challenges and opportunities of remotely working from home during Covid-19 pandemic. Product Innovation Centre, Nottingham Trent University.

² Lal, B., Dwivedi, Y. K., & Haag, M. (2021, August 27). Working from Home During Covid-19: Doing and Managing Technology-enabled Social Interaction with Colleagues at a Distance.

leading to job satisfaction. Plus, they can save money on transportation, childcare, and clothes!

Remote work offers numerous advantages for employers. By providing flexible work options, companies can attract and keep top talent, leading to increased employee satisfaction and loyalty, ultimately reducing turnover. Additionally, remote work cuts overhead costs associated with office space, utilities, and equipment. Expanding the talent pool to include remote workers from various locations opens up new opportunities for businesses.³

While remote work offers flexibility and independence, it also presents some challenges that can affect how well employees do their jobs and how they feel. Being far away from coworkers can lead to loneliness and less teamwork. It can be hard to separate work and personal life, which can cause stress and burnout. People might feel less connected to their company and think about quitting their jobs. Technical problems with computers and the internet can make it hard to get work done. And without a boss watching over them, some people might not work as hard or do their jobs as well.⁴

Hickman, A., & Robison, J. (2020, January 24). Is working remotely effective? Gallup research says yes. *Workplace*.

People are working from home more and more. This makes employees happier and more productive. Companies can save money and be better for the environment.

Initial Experiences with Remote Work

Before the COVID-19 pandemic, many people were unfamiliar with working from home. While some had previous experience, the majority of participants hadn't worked remotely. However, the use of online meeting tools like MS Teams skyrocketed during the pandemic, becoming essential for communication and collaboration.

Attitudes Towards Remote Work

Despite the challenges, most people believed that working from home could be just as effective as working in an office. This suggests that remote work has the potential to be a viable long-term option for many.

Challenges of Remote Work

Adjusting to working from home wasn't easy for everyone. Many people struggled with the lack of face-to-face interaction, finding it difficult to maintain social connections with colleagues. Additionally, challenges like balancing work and personal life, creating a suitable workspace, and managing distractions at home were common hurdles.

As we see, most studies focus on the short term. There is no study that has examined the impact on the employee in the long term and the impact of working online on his social and health life and the development of his social skills.

For entrepreneurs , investing in employee well-being is not merely a philanthropic endeavor but a strategic business decision. By prioritizing employee satisfaction, companies can cultivate a more productive, innovative, and resilient workforce. A positive work environment leads to increased employee morale, reduced turnover, and enhanced company reputation. Furthermore, it can contribute to significant cost savings through improved employee health and reduced absenteeism.

Employees stand to benefit immensely from a positive work environment. A supportive workplace fosters improved mental and physical health, heightened job satisfaction, and a better work-life balance. When employees feel valued and appreciated, they are more likely to be engaged, motivated, and committed to their roles.

From a research perspective, the emergence of remote work presents a rich landscape for exploration. Unraveling the long-term implications of remote work on employee well-being, productivity, and job satisfaction is crucial for understanding the future of work. By investigating the factors that contribute to positive employee experiences in remote settings, researchers can provide valuable insights for both organizations and individuals.

This comprehensive overview underscores the interconnectedness of employee well-being, organizational success, and the broader societal implications of remote work. A deeper understanding of these dynamics is essential for creating a future where work is both fulfilling and sustainable.

1.2. Research Problem

Working from home allows the employee to choose times that suit him to work, but does this affect the employee's love of work and make him unclear at work and his colleagues who work from the office appear more clearly? Or does it provide him with an opportunity for excellence and creativity? Did flexible working hours make the employee not adhere to fixed sleep times, which negatively affected his health, or did it make his day more effective?

1.2.1. Theoretical Gaps

Lack of comprehensive theoretical frameworks:

- **What does this mean?** It means that there isn't a clear, big picture explanation for how remote work affects people over a long time.
- **Example:** We might know that remote work can lead to more flexibility, but we don't fully understand how this flexibility influences an employee's overall job satisfaction and well-being in the long run.

Inconsistent findings:

- **What does this mean?** Different studies have found different results about remote work.
- **Example:** Some studies say remote work increases productivity, while others say it decreases it. This makes it hard to know what to believe.

1.2.2. Practical Gaps

Experimental studies have examined the impact of remote work on employees, but there is no study that focused on all aspects. While some studies focused on job performance only, others focused on the social life of the employee only, which created a gap in the literature that needs to be addressed.

Main research question:

Does working remotely for long periods make the employee's life better in the long run in all aspects, whether functional or social, or does it make it worse?

1.3. Research Significance

In this section, the student should clarify the importance of the study at the theoretical level, and the empirical level

1.3.1. At the theoretical level

Theoretically, this research contributes to the emerging body of knowledge on the long-term implications of remote work. By examining the multifaceted effects of remote work on employees, this study challenges existing assumptions and offers new perspectives on work-life balance, job satisfaction, and employee well-being. Furthermore, the findings may lead to the development of more comprehensive

theoretical frameworks that explain the complex interplay between individual, organizational, and technological factors in remote work environments.

1.3.2. At the practical level

This research holds significant practical implications for various stakeholders. For employees , the findings will shed light on the long-term effects of remote work on their well-being, work-life balance, and career progression. This knowledge can empower employees to make informed decisions about their work arrangements and advocate for supportive workplace policies.

For employers , the study will provide valuable insights into optimizing remote work environments. By understanding the challenges and opportunities associated with remote work, organizations can implement strategies to enhance employee satisfaction, productivity, and retention.

Moreover, policymakers can leverage the research to develop effective regulations and support systems for remote workers. For instance, policies related to labor rights, health and safety, and equal opportunities can be informed by the findings.

1.4. Research Questions

- How does remote work impact employees' mental health and well-being over time?
- To what extent does remote work contribute to or hinder employees' career development?
- What are the most effective strategies for organizations to support employee well-being in remote work environments?

1.5. Research Objectives

Determine the real effects of working remotely from home on the employee in the long term

What is the ideal work environment for remote work?

1.6. Research Hypotheses

Hypothesis 1:

If employees work remotely for extended periods, then their overall job satisfaction will decrease due to factors such as decreased social interaction and work-life imbalance.

Hypothesis 2:

If employees have access to adequate technology and support, then they will experience higher levels of job satisfaction and productivity while working remotely.

1.7. Research Model

Correlational

Data Collection Method: Survey

A survey will be used to gather data from a sample of remote workers. The survey will include questions about:

- Demographics (age, gender, occupation, industry)
- Number of hours spent working remotely
- Frequency of use of different communication tools
- Perceptions of job satisfaction
- Feelings of isolation

Data Analysis: Statistical Analysis

Correlational analysis will be used to determine the strength and direction of relationships between variables. Statistical software (like SPSS or R) will be used to calculate correlation coefficients.

Sample: Remote Workers

A sample of remote workers from various industries will be selected to ensure the representativeness of the study.

Ethical Considerations:

1. Informed Consent

- **Explain the study clearly:** Tell people what the research is about in a way they can understand.
- **Get permission:** People should agree to be part of the study after knowing all the details.

2. Confidentiality

- **Keep information private:** Protect people's personal information.
- **Don't share details:** Only use information for the research and don't tell others about specific people.

3. Voluntary Participation

- **No pressure:** People should choose to be in the study without feeling forced.
- **Right to quit:** People can stop being part of the study at any time.

4. Minimize Harm

- **Protect people:** Make sure the research doesn't hurt anyone physically or emotionally.
- **Be careful with questions:** Avoid asking questions that could upset people.

5. Accuracy and Honesty

- **Tell the truth:** Report research results honestly and accurately.
- **Don't make things up:** Be truthful about the research process.

1.8. Research Methodology

This study employed a correlational research design to examine the relationship between the number of hours spent working remotely and job satisfaction among employees in the IT industry. Data was collected through an online survey distributed to a sample of 200 remote workers. Survey responses were analyzed using statistical software to calculate correlation coefficients.

1.9. Scope of The Study

This study focuses on the relationship between the number of hours spent working remotely and job satisfaction among full-time employees in the IT industry within ksa. Data will be collected from a sample of remote workers during the year 2020-202

2.Chapter 2: Literature Review

2.1. Introduction

Previous work that dealt with the impact of post-work varied. Some work paid attention, including the companies that provided it with money, when the staff works from home. Some research paid attention to the quality of the work that employees perform and other things, but what about the experience in involving all participants together to see a comprehensive look at Al-Baadi let a permanent employee receive money without the need for him to leave the house and replace him with more money than he did by paying this money through private means and his social relationships, so he finds himself adopting a short night out, personal relationships, and he has no co-workers.

Let's review some of these studies together:

- 1- "The impact of time spent working from home on affective commitment in the -workplace: The mediating role of social relationships and collective aims A. Simon, Gabor Aranyi, K. Faragó+2 more · 13 January 2023 "

Abstract of the research :

Introduction Working from home has become increasingly prevalent due to the COVID-19 pandemic, creating new challenges for organizations and employees. According to the latent deprivation model proposed by Jahoda, work provides latent benefits alongside its material rewards, and losing such benefits leads to a decline in well-being. Organizational affective commitment, or affective commitment within the organization, is a prominent concept in organizational psychology that is linked to lower workforce fluctuation and increased work performance. The present research examined the impact of time spent working from home on affective commitment by examining Jahoda's "latent functions," including social contact and collective purpose, representing an innovative application of the latent deprivation model in the context of home office. **Methods** Using an online questionnaire, we collected data from 456 participants (239 female and 217 male) who had been employed for at least 2 years and who had spent a proportion of their time working from home in March and April 2021. The data were analyzed using a path model, in which the potential adverse effect of time spent in home office on affective commitment to the workplace was mitigated by latent functions. **Results** Specifically, we found that more time spent in home office was associated with a decrease in social contact, the impact of which on affective commitment was mediated through the perception of collective purpose. **Discussion** Our findings emphasize the role of the latent benefits of work

experienced by employees even when working from home, and the role of those benefits in supporting employees' commitment to the workplace. We argue that a deeper understanding of such factors is vital, as working from home is expected to remain widespread even after the pandemic.

- 2- Lal, B., Dwivedi, Y. K., & Haag, M. (2021, August 27). Working from Home During Covid-19: Doing and Managing Technology-enabled Social Interaction With Colleagues at a Distance.

Abstract

With the overnight growth in Working from Home (WFH) owing to the pandemic, organisations and their employees have had to adapt work-related processes and practices quickly with a huge reliance upon technology. Everyday activities such as social interactions with colleagues must therefore be reconsidered. Existing literature emphasises that social interactions, typically conducted in the traditional workplace, are a fundamental feature of social life and shape employees' experience of work. This experience is completely removed for many employees due to the pandemic and, presently, there is a lack of knowledge on how individuals maintain social interactions with colleagues via technology when working from home. Given that a lack of social interaction can lead to social isolation and other negative repercussions, this study aims to contribute to the existing body of literature on remote working by highlighting employees' experiences and practices around social interaction with colleagues. This study takes an interpretivist and qualitative approach utilising the diary-keeping technique to collect data from twenty-nine individuals who had started to work from home on a full-time basis as a result of the pandemic. The study explores how participants conduct social interactions using different technology platforms and how such interactions are embedded in their working lives. The findings highlight the difficulty in maintaining social interactions via technology such as the absence of cues and emotional intelligence, as well as highlighting numerous other factors such as job uncertainty, increased workloads and heavy usage of technology that affect their work lives. The study also highlights that despite the negative experiences relating to working from home, some participants are apprehensive about returning to work in the traditional office place where social interactions may actually be perceived as a distraction. The main

contribution of our study is to highlight that a variety of perceptions and feelings of how work has changed via an increased use of digital media while working from home exists and that organisations need to be aware of these differences so that they can be managed in a contextualised manner, thus increasing both the efficiency and effectiveness of working from home.

- 3- Niebuhr, F., Borle, P., Börner-Zobel, F., & [Last name of fourth author]. (2022, January 20). Healthy and Happy Working from Home? Effects of Working from Home on Employee Health and Job Satisfaction.

Abstract

In addition to its catastrophic health effects, the COVID-19 pandemic also acts as a catalyst for new forms of work. Working from home (WFH) has become commonplace for many people worldwide. But under what circumstances is WFH beneficial and when does it increase harms to health? The aim of this study was to investigate the influence of specific characteristics of WFH for health (work ability, stress-related physical and psychological symptoms) and job satisfaction among German employees. The study is based on data from a Germany-wide panel survey with employees from different industries ($n = 519$). Using multiple regressions, it was found that the functionality of the technical equipment at home has positive effects on the health of employees (i.e., ability to work, stress-related symptoms) and job satisfaction. The percentual weekly amount of WFH influences stress-related symptoms, i.e., a higher amount of weekly working time WFH, was associated with more stress-related symptoms. Furthermore, it negatively influences job satisfaction. The feeling of increased autonomy leads to positive effects on employees' job satisfaction. The results provide starting points for interventions and indicate the need for legal regulations for WFH. Further theoretical and practical implications are discussed.

2.2. The independent variable

The independent variable is the factor that manipulate or control in OUR research. It's the variable that WE believe has an effect on the dependent variable.

In the context of remote work, the independent variable will be:

Number of hours spent working remotely

Type of communication tools used

Job role or industry

Remember: The independent variable is what we change or observe to see if it affects something else.

2.3. The dependent variable

The dependent variable is what we measure or observe in our research.

It's the outcome or effect that you're trying to study.

In the context of remote work, the dependent variable will be:

Job satisfaction

Productivity

Work-life balance

Employee turnover

2.4. The relationship between the independent and the dependent variables

The relationship between them is close, some of which are direct and some of which are inverse. Certainly, if the number of daily working hours increases significantly, this will put pressure on the worker and make him feel that he is not living his life and that his entire day is wasted on his work. On the other hand, the working hours should not be short either because this may create a feeling of

neglect that does not... The benefit of its existence is in addition to the fact that all non-independent variables are only results of changing the independent variables

2.5. Conclusion

In conclusion, this study aims to investigate the long-term effects of remote work on employee well-being and job satisfaction. Utilizing a correlational design, the research will explore the relationship between the number of hours spent working remotely and various dependent variables, including job satisfaction, work-life balance, and mental health. By examining these connections, the study seeks to contribute to the theoretical understanding of remote work's impact on individuals. Furthermore, the findings can benefit employees, organizations, and policymakers by providing insights for optimizing remote work arrangements and ensuring employee well-being in the long term. Future research could explore the influence of specific remote work practices, cultural contexts, and individual personalities on these outcomes.

3.Chapter 3: Results

3.1. Survey Question:

The survey questions were carefully selected to reflect the employees' social life and whether remote working hours affected their relationships with those around them and their satisfaction with their social life and their satisfaction with their work. I could have added more detailed questions about the employee's social life and the activities he does in his life away from work, but I preferred to use shorter questions so that the survey would not be long and boring. The survey questions were as follows:

- How many hours do you work remotely per day
- How many days off per week
- How would you describe your relationship with coworkers
- Do you have a routine that organizes your day
- How would you describe your social life outside of work
- Are you satisfied with your job
- Do you feel that working remotely has a negative impact on your social life

3.2. Survey answer distribution percentages:

The survey was conducted on 100 people and their answers were collected

And analyzed using Excel

Let's review the survey results together

Figure 1-Distribution of answers to question 1

How would you describe your relationship with coworkers

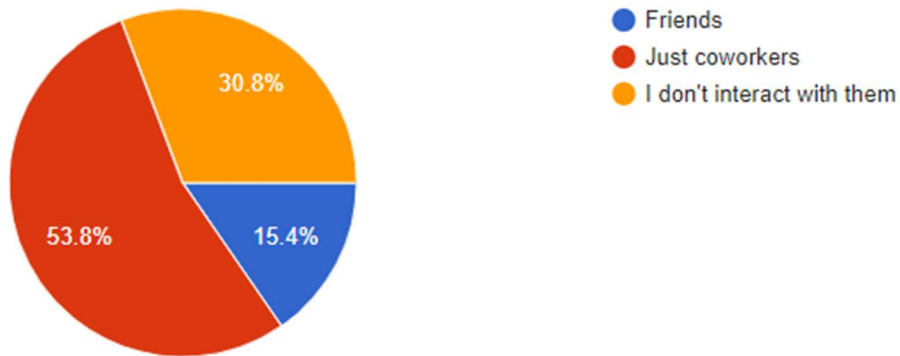

Figure 2-Distribution of answers to question 2

How many days off per week

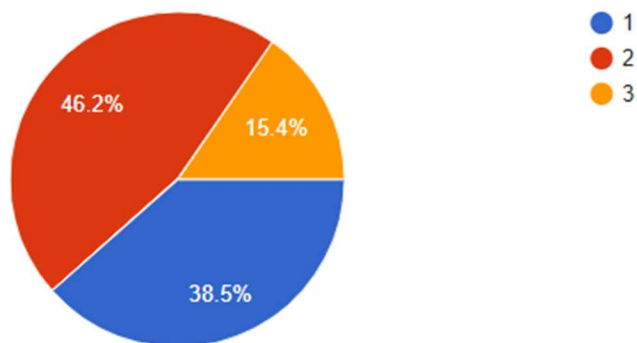

Figure 3-Distribution of answers to question 3

Do you have a routine that organizes your day

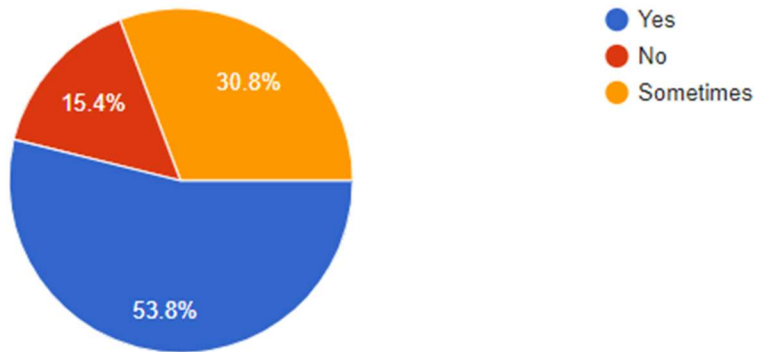

Figure 4-Distribution of answers to question 4

How would you describe your social life outside of work

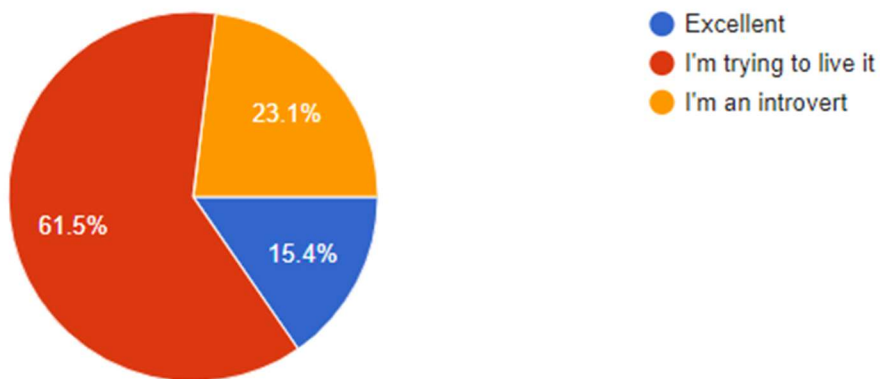

Figure 5-Distribution of answers to question 5

Are you satisfied with your job

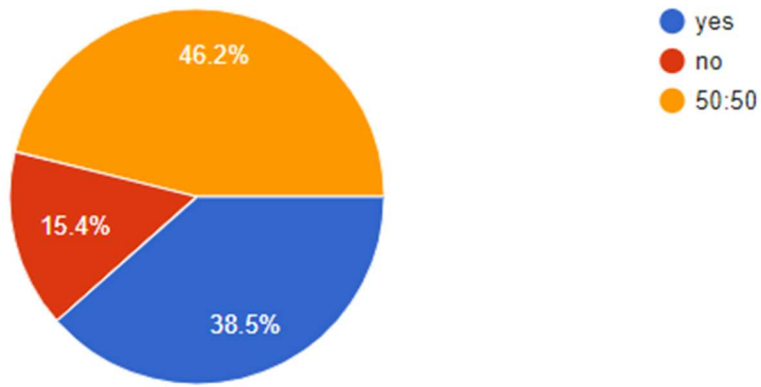

Figure 6-Distribution of answers to question 6

Do you feel that working remotely has a negative impact on your social life

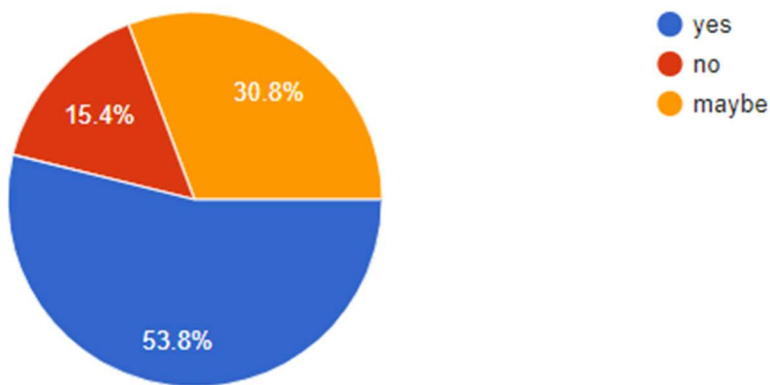

Figure 7-Distribution of answers to question 7

3.3. Analyze results:

The most important findings that can be drawn from this survey:

1. Number of remote working hours: Most participants work between 6-8 hours per day, with some working more or less.
2. Relationship with colleagues: The majority of participants describe their relationship with their colleagues as limited or merely a work relationship. Very few have friendly relationships with their colleagues.
3. Daily routine: Most participants try to organize their day, but do not necessarily have a fixed routine.
4. Social life outside of work: There is a difference in the answers to this question. Some participants describe their social life as good, while a large percentage feel that it suffers due to working remotely.
5. Job satisfaction: Most participants are satisfied with their jobs, but there are some doubts about the extent to which some are satisfied with their lives in general.
6. The impact of remote work on social life: There is a clear consensus on this question. Half of the participants feel that remote work has negatively affected their social life, while others see that the impact is not significant or that it is not influential.

Through these results, we clearly see that the complete transition to remote work has negatively affected a large percentage of employees in their personal lives.

It has also affected the work environment, as many participants see their colleagues at work as mere passing colleagues, and few of them consider them their friends.

This is not healthy in the work environment because it reduces the employee's loyalty to the place and does not make him feel that this institution or company is his second home, which will reduce his productivity at work and make his attachment to the place less, which will facilitate his transition to another job at any appropriate opportunity.

3.4. Answering research questions

- **How does remote work impact employees' mental health and well-being over time?**

Flexible Work Arrangements: The ability to work from home can offer greater flexibility, allowing employees to balance work and personal life more effectively, potentially reducing stress and improving work-life balance.

Increased Autonomy: Remote work can provide employees with a greater sense of autonomy and control over their work environment, which can boost job satisfaction.

Potential Negative Impacts:

Social Isolation: Working remotely can lead to social isolation, as employees may have fewer opportunities for face-to-face interactions with colleagues. This can contribute to feelings of loneliness and decreased morale.

Blurred Boundaries: The lack of a physical separation between work and personal space can make it difficult to establish clear boundaries, leading to burnout and work-related stress.

Lack of Social Support: Remote employees may have fewer opportunities for informal social interactions and support from colleagues, which can impact their mental health.

- **To what extent does remote work contribute to or hinder employees' career development?**

Potential Challenges for Career Development: Limited Visibility:

The survey indicates that remote employees may have fewer opportunities for face-to-face interactions with colleagues and senior management, which can limit their visibility and hinder career advancement.

- **What are the most effective strategies for organizations to support employee well-being in remote work environments?**

One of the best solutions to combine the two systems and benefit from the advantages of each is the hybrid system, where the employee works from home and must work from the office three days a week.

This will provide him with direct contact with colleagues, encourage each other face to face, create a sense of connection between them, and prevent him from isolating himself at home where he works and lives without feeling it.

Also, on the other hand, it will leave him about half the week to work from home, so that he can organize his time and work schedules in a way that suits him, as long as he completes the tasks required of him at the required time.
