E-business infrastructure

Lecture 3

MGM 212

Prepared by
Dr. Magdy Alhaj

www.midocean.ae

Lecture 1: Introduction to e-business and e-commerce.

Lecture 2: E-commerce fundamentals.

Lecture 3: E-business infrastructure.

Lecture 4: - E-environment.

Lecture 5: E-business strategy.

Lecture 6: E-procurement.

Lecture 7: E-marketing.

Lecture 8: Customer relationship management.

Lecture 9: Analysis and design.

Lecture 10: Implementation and maintenance.

LECTURE OUTLINE

1. Introduction.

- E-business infrastructure.**
- E-business infrastructure components.**

2. Internet technology.

- Hosting of web sites and e-business services.**
- The Internet timeline.**

3. Web technology.

4. Managing e-business infrastructure.

LEARNING OBJECTIVES

After completing this chapter the student should be able to:

1. Outline the hardware and software technologies used to build an e-business infrastructure within an organization and with its partners
2. Outline the hardware and software requirements necessary to enable employee access to the Internet and hosting of e-commerce services.

Lecture

03

TITLE OF LECTURE

E-business infrastructure

1. Introduction:

Defining an adequate technology infrastructure is vital to all companies adopting e-business. The infrastructure directly affects the quality of service experienced by users of the systems in terms of speed and responsiveness. The e-business services provided through a standardized infrastructure also determine the capability of an organization to compete through differentiating itself in the marketplace. **Mcafee and Brynjolfsson** suggest that to use digital technology to support competition the mantra for the CEO should be:

Lecture

03

TITLE OF LECTURE

E-business infrastructure

- E-business infrastructure

refers to the combination of hardware such as servers and client PCs in an organization, the network used to link this hardware and the software applications used to deliver services to workers within the e-business and also to its partners and customers. Infrastructure also includes the architecture of the networks, hardware and software and where it is located.

Lecture

03

TITLE OF LECTURE

E-business infrastructure

Finally, infrastructure can also be considered to include the methods for publishing data and documents accessed through e-business applications. A key decision with managing this infrastructure is which elements are located within the company and which are managed externally as third-party managed applications, data servers and networks.

Lecture
03**TITLE OF LECTURE**
E-business infrastructure**- E-business infrastructure components**

Figure 3.1 summarizes how the different components of e-business architecture which need to be managed relate to each other. The different components can be conceived of as different layers with defined interfaces between each layer. The different layers can best be understood in relation to a typical task performed by a user of an e-business system.

Lecture

TITLE OF LECTURE

E-business infrastructure

Figure 3.1

A five-layer model of e-business infrastructure

Lecture
03**TITLE OF LECTURE**
E-business infrastructure

For example, an employee who needs to book a holiday will access a specific human resources application or program that has been created to enable the holiday to be booked (Level I in Figure 3.1). This application will enable a holiday request to be entered and will forward the application to their manager and human resources department for approval. To access the application, the employee will use a web browser such as Microsoft Internet Explorer, Mozilla Firefox or Google Chrome using an operating system such as Microsoft Windows XP or Apple OS X (Level II in Figure 3.1).

TITLE OF LECTURE

E-business infrastructure

This systems software will then request transfer of the information about the holiday request across a network or transport layer (Level III in Figure 3.1). The information will then be stored in computer memory (RAM) or in long-term magnetic storage on a web server (Level IV in Figure 3.1). The information itself which makes up the web pages or content viewed by the employee and the data about their holiday request are shown as a separate layer (Level V in Figure 3.1), although it could be argued that this is the first or second level in an e-business architecture.

TITLE OF LECTURE

E-business infrastructure

2. Internet technology:

As you will know, the **Internet** enables communication between millions of connected computers worldwide, but how does the seamless transfer of data happen? Requests for information are transmitted from client computers and mobile devices whose users request services to server computers that hold information and host business applications that deliver the services in response to requests. Thus, the Internet is a large-scale **client/server** system.

TITLE OF LECTURE

E-business infrastructure

Figure 3.2 shows how the client computers within homes and businesses are connected to the Internet via local Internet service providers (ISPs) which, in turn, are linked to larger ISPs with connection to the major national and international infrastructure or backbones which are managed by commercial.

TITLE OF LECTURE

E-business infrastructure

**Figure 3.2**

Physical and network infrastructure components of the Internet (Levels IV and III in Figure 3.1)

TITLE OF LECTURE

E-business infrastructure

Globally, there are many submarine cables which form the backbone between countries, which are susceptible to damage, for example in January 2008 a ship's anchor severed a cable in the Mediterranean resulting in a dramatic slowdown in Internet access for people in India, Sri Lanka, Pakistan and the Middle East.

TITLE OF LECTURE

E-business infrastructure

- Hosting of web sites and e-business services:

While it is possible for companies to manage their own services by setting up web servers within their own company offices, or to use their ISP, it is common practice to use a specialist **hosting provider** to manage this service. For example, Rackspace (Figure 3.3) describe itself as 'Europe's fastest growing hosting company'. Since 2001 Rackspace has been hosting and supporting mission critical web sites, Internet applications, e-mail servers, security and storage services for over 4,000 customers. Rackspace also has US offices.

TITLE OF LECTURE

E-business infrastructure

Figure 3.3

Example hosting provider Rackspace (www.rackspace.com)

TITLE OF LECTURE

E-business infrastructure

- The Internet timeline:

The Internet is only the latest of a series of developments in the way that the human race has used technology to disseminate information. **Kampas** identifies ten stages that are part of five 'mega waves' of change. The first six stages are summarized in Table 3.2. It is evident that many of the major advances in the use of information have happened within the last hundred years. This indicates that the difficulty of managing technological change is likely to continue. Kampas goes on to speculate on the impact of access to lower-cost, higher-bandwidth technologies.

TITLE OF LECTURE

E-business infrastructure

Table 3.2

Six stages of advances in the dissemination of information

Stage	Enabling technology	Killer applications* and impact
1 Documentation: 3500 BC to AD 1452	Written language and the development of clay tablets in Mesopotamia	Taxes, laws and accounting giving rise to the development of civilization and commerce
2 Mass publication: 1452 to 1946	The Gutenberg press of movable metal type	Demand for religious and scientific texts resulting in scientific advances and ideological conflicts
3 Automation: 1946 to 1978	Electric power and switching technologies (vacuum tubes and transistors)	Code breaking and scientific calculations. Start of information age
4 Mass interaction: 1978 to 1985	Microprocessor and personal computer	Spreadsheets and word processing
5 Infrastructuralization: 1985 to 1993	Local- and wide-area networks, graphical user interfaces	E-mail and enterprise resource planning
6 Mass communication: 1993 to c.2010	Internet, World Wide Web, Java	Mass information access for communications and purchasing

*Very useful applications which will encourage adoption of a technology.

TITLE OF LECTURE

E-business infrastructure

- Intranet applications

Intranets are used extensively for supporting sell-side e-commerce from within the marketing function. They are also used to support core supply-chain management activities as described in the next section on extranets. **A marketing intranet has the following advantages:**

TITLE OF LECTURE

E-business infrastructure

- Reduced product lifecycles – as information on product development and marketing campaigns is rationalized we can get products to market faster.
- Reduced costs through higher productivity, and savings on hard copy.
- Better customer service – responsive and personalized support with staff accessing customers over the web.
- Distribution of information through remote offices nationally or globally.

TITLE OF LECTURE

E-business infrastructure

Intranets are also used for internal marketing communications since they can include the following types of information:

- Staff phone directories;
- Staff procedures or quality manuals;
- Information for agents such as product specifications, current list and discounted prices, competitor information, factory schedules, and stocking levels, all of which normally have to be updated frequently and can be costly;
- Staff bulletin or newsletter;
- Training courses.

TITLE OF LECTURE

E-business infrastructure

- Extranet applications

Although an extranet may sound complex, from a user point of view it is straightforward. If you have bought a book or CD online and have been issued with a username and password to access your account, then you have used an extranet. This is a consumer extranet. Extranets are also used to provide online services which are restricted to business customers.

TITLE OF LECTURE

E-business infrastructure

Vlosky et al. (2000) refer to these business benefits of an extranet:

- 1. Information sharing in secure environment.** Information needed to support business through a range of business partners can be shared using an extranet.
- 2. Cost reduction.** Operating processes can be made more efficient through an extranet.
- 3. Order processing and distribution.** The authors refer to an 'electronic integration effect'.
- 4. Customer service.** Improving levels of service is one of the main benefits of the Premier Dell.com extranet described above although it also has the other benefits listed above.

TITLE OF LECTURE

E-business infrastructure

- Firewalls

Firewalls are necessary when creating an intranet or extranet to ensure that outside access to confidential information does not occur. Firewalls are usually created as software mounted on a separate server at the point where the company is connected to the Internet. Firewall software can then be configured to only accept links from trusted domains representing other offices in the company. A firewall has implications for e-marketing since staff accessing a web site from work may not be able to access some content such as graphics plugins.

TITLE OF LECTURE

E-business infrastructure

- Encouraging use of intranets and extranets

Although intranets and extranets have many benefits for the business, they often represent a change to existing methods of working for business people. As such, encouraging their usage is often a **challenge**. In many ways, this challenge is similar to encouraging customers to use open-access web sites.

TITLE OF LECTURE

E-business infrastructure

3. Web technology:

The World Wide Web, or 'web' for short, has proved so successful since it provides a standard method for exchanging and publishing information on the Internet.

- Web browsers and servers

Web browsers are software such as Microsoft Internet Explorer and Mozilla Firefox which we use to access the information on the WWW that is stored on web servers.

TITLE OF LECTURE

E-business infrastructure

- Web servers

Web servers are used to store, manage and supply the information on the WWW. The main web browsers are Microsoft Internet Explorer and Mozilla Firefox with the Apple Safari browser and Google Chrome having relatively small market share. Browsers display the text and graphics accessed from web sites and provide the interactions.

TITLE OF LECTURE

E-business infrastructure

4. Managing e-business infrastructure:

As explained at the start of the chapter, e-business infrastructure comprises the hardware, software, content and data used to deliver e-business services to employees, customers and partners. In this part of the chapter we look at the management of e-business infrastructure by reviewing different perspectives on the infrastructure. **These are:**

TITLE OF LECTURE

E-business infrastructure

- 1. Hardware and systems software infrastructure.** This refers mainly to the hardware and network infrastructure discussed in the previous sections. It includes the provision of clients, servers, network services and also systems software such as operating systems and browsers (Layers II, III and IV in Figure 3.1).
- 2. Applications infrastructure.** This refers to the applications software used to deliver services to employees, customers and other partners (Layer I in Figure 3.1).

TITLE OF LECTURE

E-business infrastructure

1. Managing hardware and systems software infrastructure:

Management of the technology infrastructure requires decisions on Layers II, III and IV in Figure 3.1.

Layer II – Systems software

The key management decision is standardization throughout the organization. Standardization leads to reduced numbers of contacts for support and maintenance and can reduce purchase prices through multi-user licences.

TITLE OF LECTURE

E-business infrastructure

- Layer III – Transport or network

Decisions on the network will be based on the internal company network, which for the e-business will be an intranet, and for the external network either an extranet or VPN or links to the public Internet.

TITLE OF LECTURE

E-business infrastructure

- Layer IV – Storage

The decision on storage is similar to that for the transport layer. Storage can be managed internally or externally. This is not an either–or choice. For example, intranet and extranet are commonly managed internally while Internet storage such as the corporate web site is commonly managed externally or at an application service provider. However, intranets and extranets can also be managed externally.

TITLE OF LECTURE

E-business infrastructure

Managing Internet service and hosting providers:

Service providers who provide access to the Internet for consumers or businesses are usually referred to as 'ISPs' or 'Internet service providers'. ISPs may also host the web sites which publish a company's web site content. But many organizations will turn to a separate hosting provider to manage the company's web site and other e-business services accessed by customers and partners such as extranets, so it is important to select an appropriate hosting provider.

Lecture

03

TITLE OF LECTURE

E-business infrastructure

- ISP connection methods

Figure 3.2 shows the way in which companies or home users connect to the Internet. The diagram is greatly simplified in that there are several tiers of ISPs. A user may connect to one ISP which will then transfer the request to another ISP which is connected to the main Internet backbone.

Lecture

03

TITLE OF LECTURE

E-business infrastructure

- Issues in management of ISP and hosting relationships

The primary issue for businesses in managing ISPs and hosting providers is to ensure a satisfactory service quality at a reasonable price. As the customers and partners of organizations become more dependent on their web services, it is important that downtime be minimized.

Lecture

03

TITLE OF LECTURE

E-business infrastructure

- Speed of access

A site or e-business service fails if it fails to deliver an acceptable download speed for users. In the broadband world this is still important as e-business applications become more complex and sites integrate more rich media such as audio and video.

Lecture

03

TITLE OF LECTURE

E-business infrastructure

- Availability

The availability of a web site is an indication of how easy it is for a user to connect to it. In theory this figure should be 100 per cent, but sometimes, for technical reasons such as failures in the server hardware or upgrades to software, the figure can drop substantially below this.

TITLE OF LECTURE

E-business infrastructure

- Service-level agreements

To ensure the best speed and availability a company should check the service-level agreements (SLAs) carefully when outsourcing web site hosting services.

- Security

Security is another important issue in service quality. How to control security was referred to in the earlier section on firewalls and is considered in detail in the Focus on security design.

TITLE OF LECTURE

E-business infrastructure

2. Managing e-business applications infrastructure:

Management of the e-business applications infrastructure concerns delivering the right applications to all users of e-business services. The issue involved is one that has long been a concern of IS managers, namely to deliver access to integrated applications and data that are available across the whole company.
